

Creating interactive browser visualizations with Bokeh

Feb 21, 2014

About Me

- Employee at Continuum Analytics
- Open-source contributor (Bokeh, Chaco, NumPy)
- Scientific, financial, engineering domains using Python, C, C++, etc.
- Interactive Visualization of “Big Data”
- Background in Physics, Mathematics

About Continuum

- Founded in 2012 by Travis Oliphant and Peter Wang
- Headquartered in Austin, TX
- Products, consulting, training
 - “big data” analytics
 - scientific & high-performance computing
 - interactive visualization, dashboards, web apps
 - collaborative analysis

Visualization

Bokeh: Interactive, browser-based visualization for big data, driven from Python (and others!)

<http://bokeh.pydata.org>

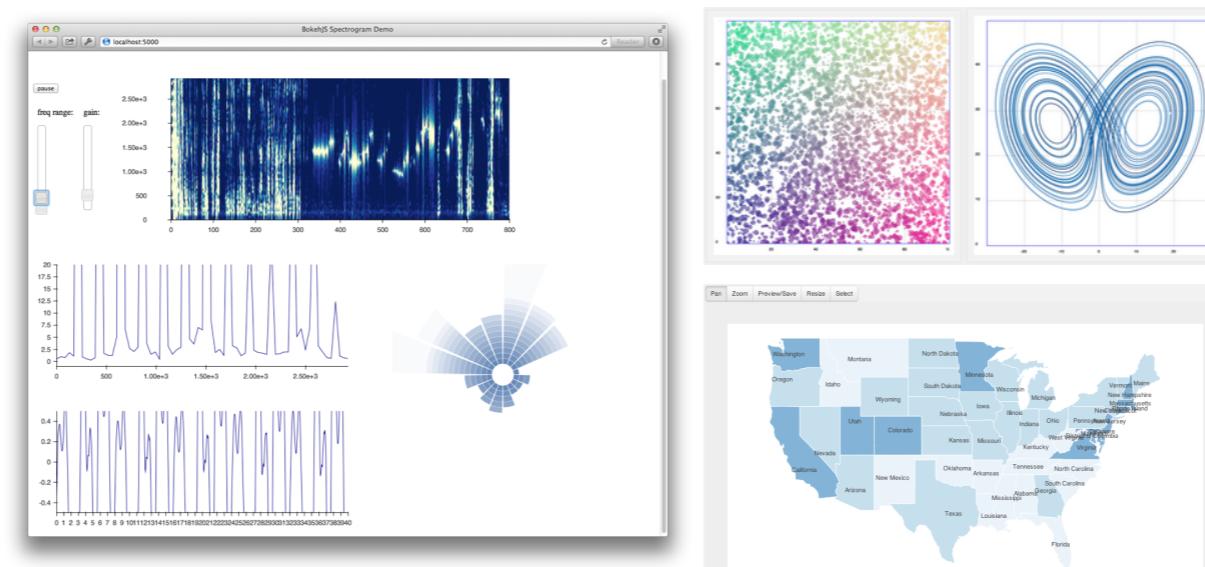

Bokeh

Interactive web viz without Javascript

Object-oriented JS runtime library for dynamic, novel, interactive web graphics

Python interfaces to output static plots or drive live ones

Interop with IPython Notebook

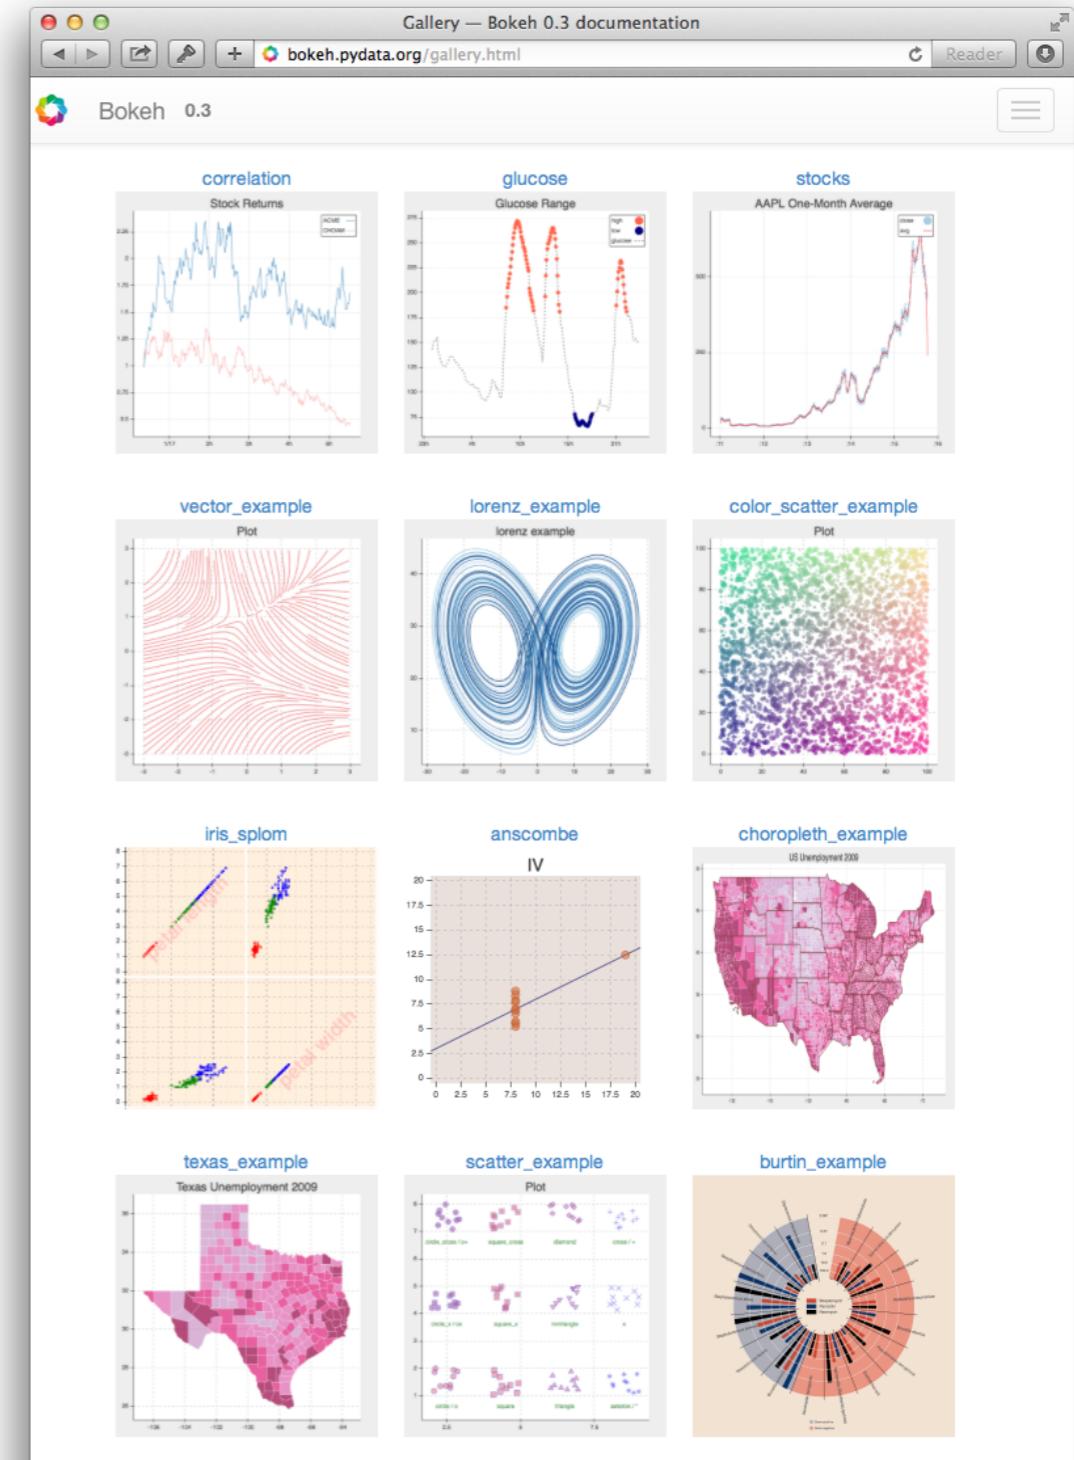

Bokeh

- Language-based (instead of GUI) visualization system
 - High-level expressions of data binding, statistical transforms, interactivity and linked data
 - Easy to learn, but expressive depth for power users
- Interactive
 - Data space configuration as well as data selection
 - Specified from high-level language constructs
- Web as first class interface target
- Support for large datasets via intelligent downsampling (“abstract rendering”)

Bokeh

- Rich interactivity over large datasets
- HTML5 Canvas (faster than SVG)
- Handles realtime streaming and updating data
- Novel & custom visualizations
- Integration with Google Maps
- No need to learn Javascript - easy interfaces from Python & other langs

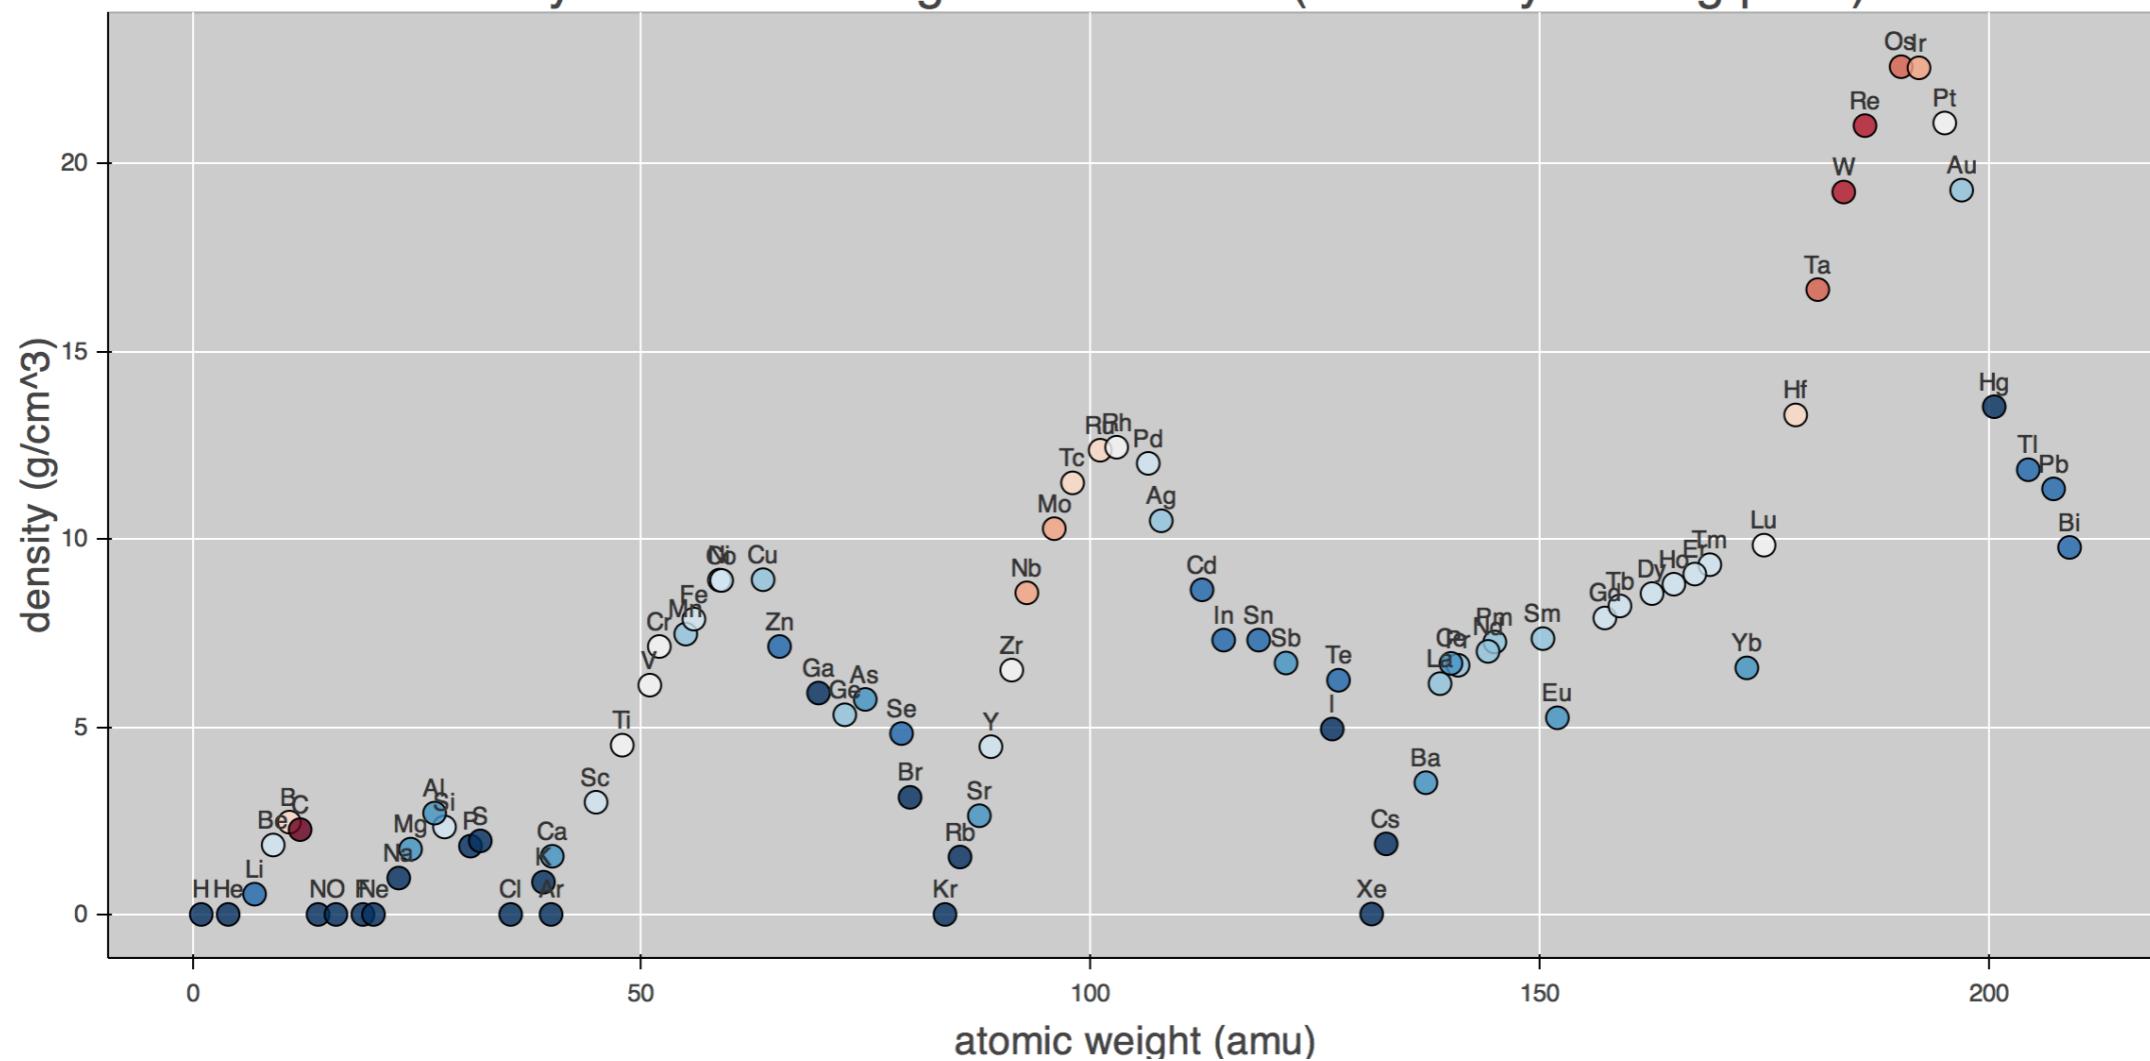

<http://bokeh.pydata.org>

Bokeh Interface Concepts

- Plots are based on glyphs
- All or almost all visual elements of a glyph can be attached to a vector of data.

Density vs Atomic Weight of Elements (colored by melting point)

```

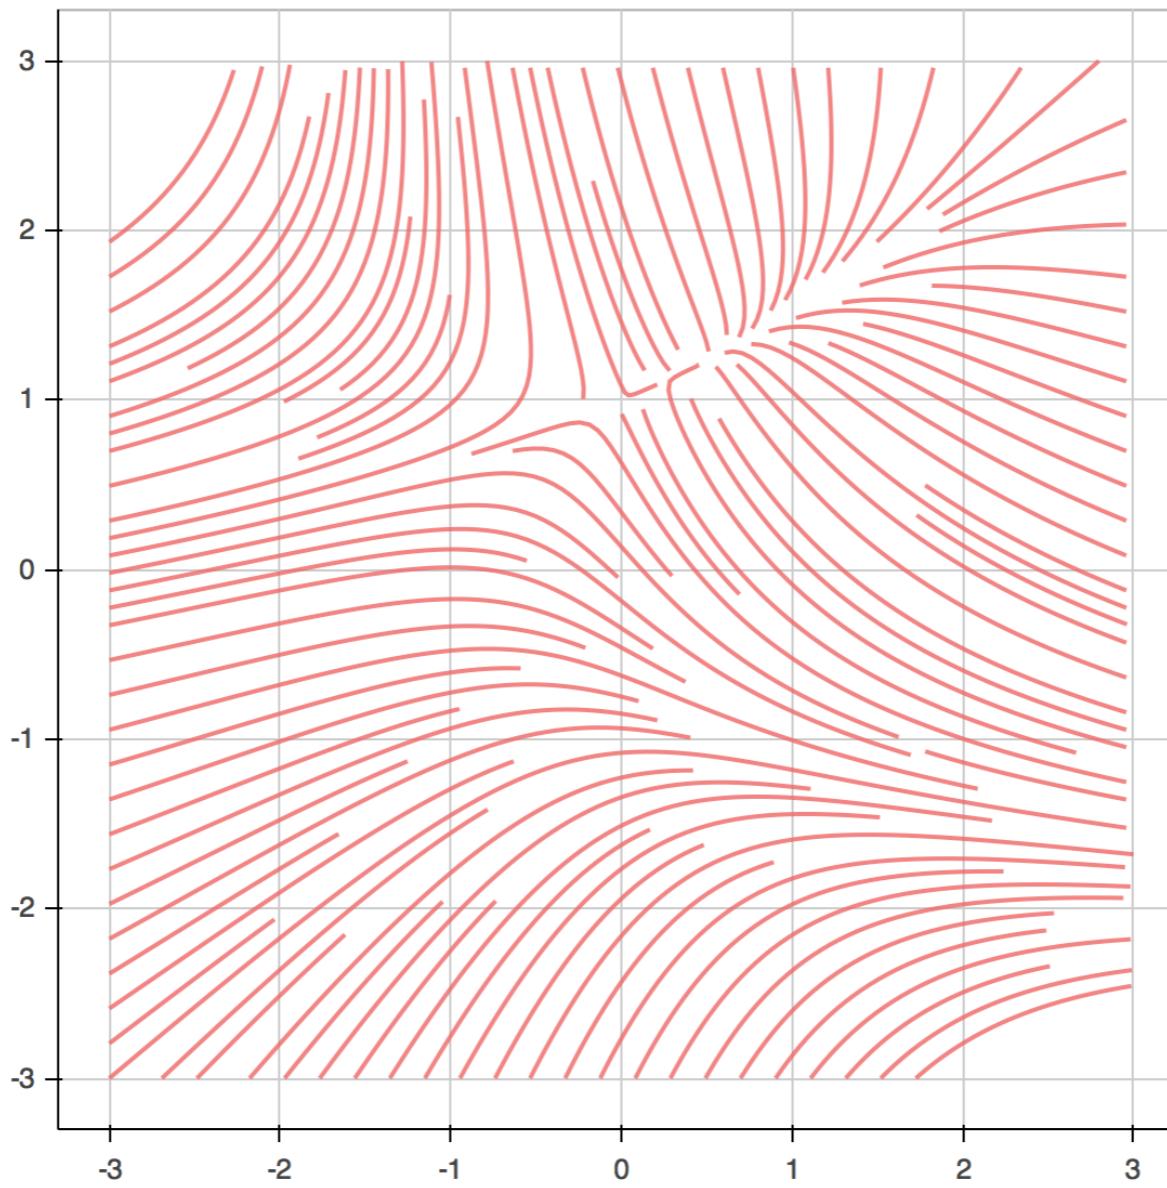

circle(elements['Atomic Mass'], elements['Density'],
       color=meltingpointcolors, plot_width=1200, line_color='black', fill_alpha=0.8,
       size=12, title='Density vs Atomic Weight of Elements (colored by melting point)',
       background_fill= '#cccccc', tools='pan, wheel_zoom, box_zoom, reset')

text(elements['Atomic Mass'], elements['Density'] +0.3,
      text=elements['Symbol'], angle=0, text_color='#333333',
      text_align="center", text_font_size="10pt")

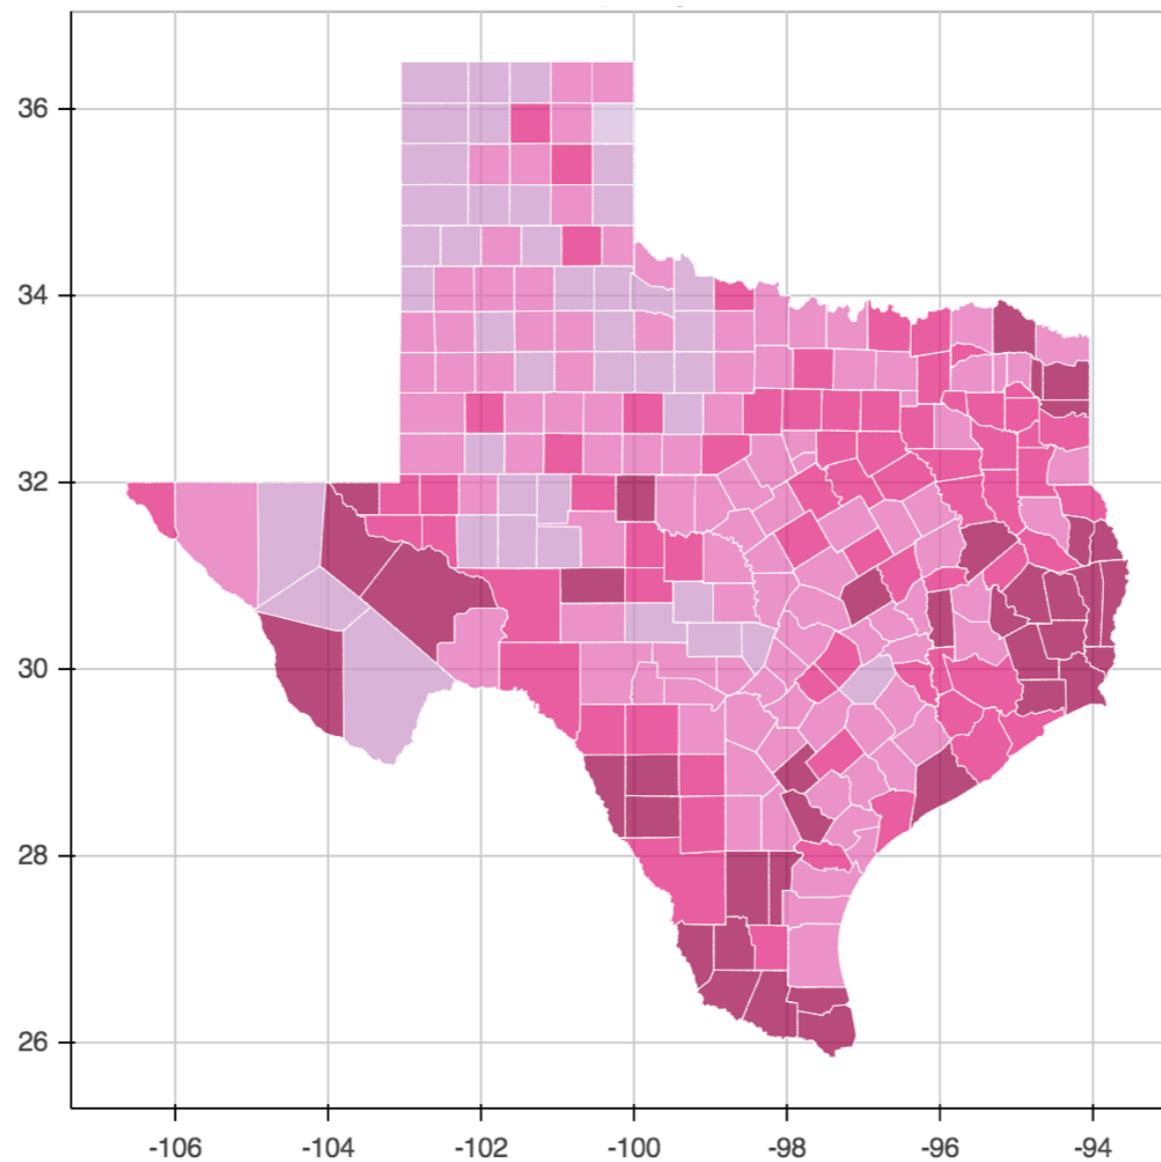

xaxis().axis_label='atomic weight (amu)'
yaxis().axis_label='density (g/cm³)'
grid().grid_line_color='white'

show()

```

```
multi_line(xs, ys,
    line_color="#ee6666", line_width=2, line_alpha=0.8,
    name="vector example", tools="pan,wheel_zoom,box_zoom,reset,previewsave"
)
show() # open a browser
```

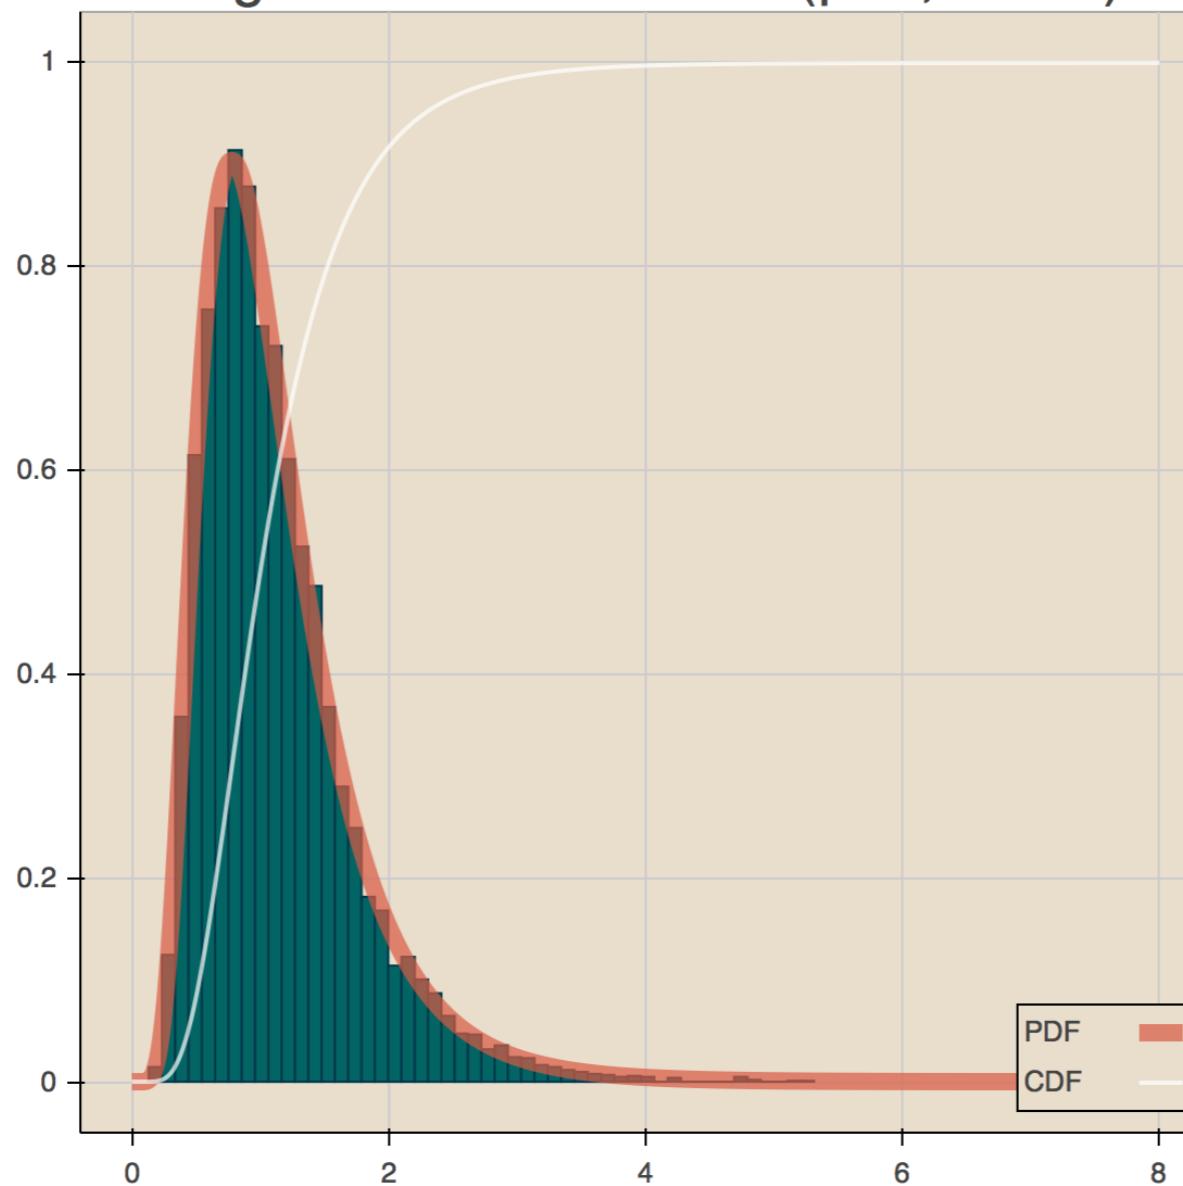

```
output_file("texas.html", title="texas.py example")

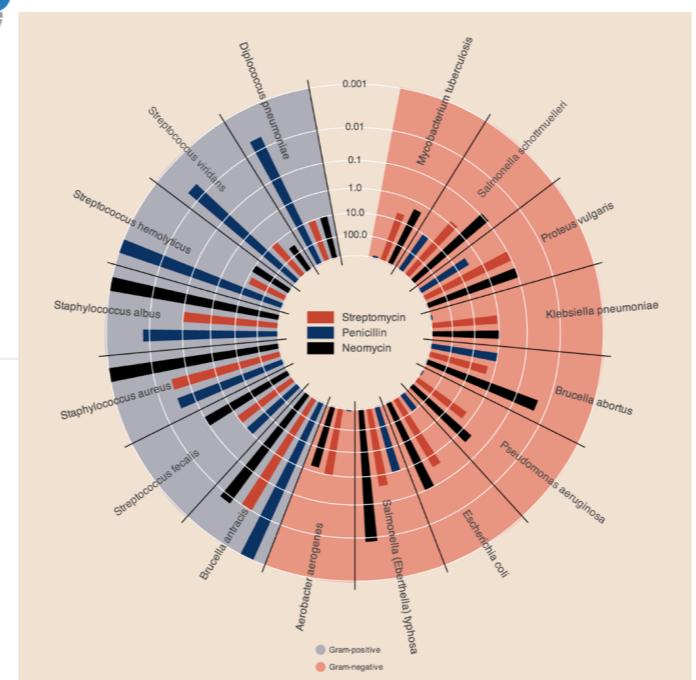

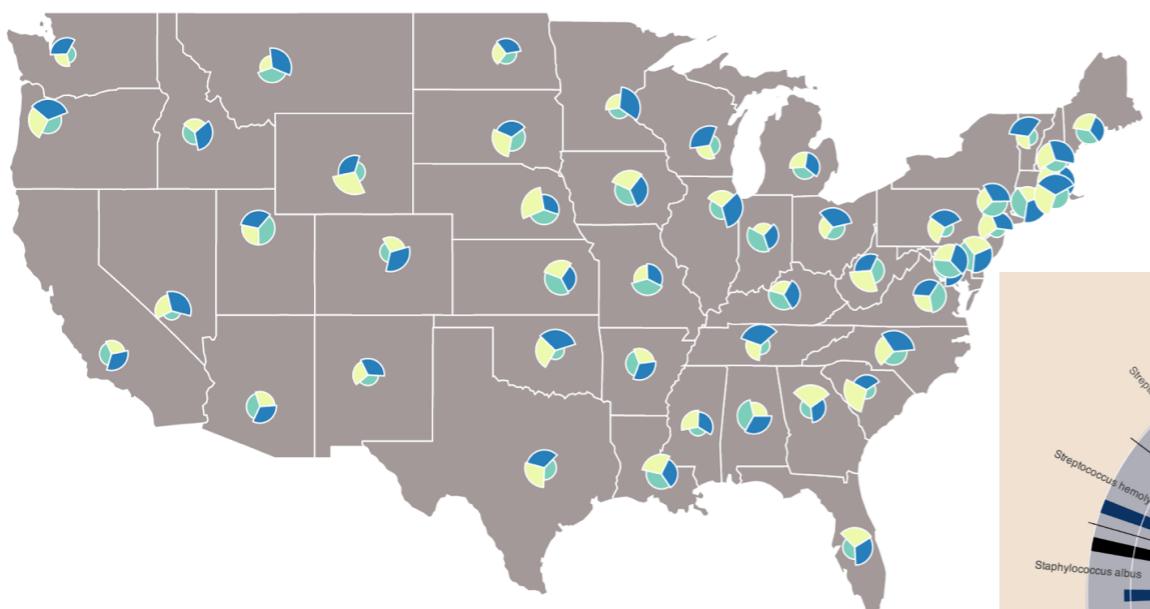

patches(county_xs, county_ys, fill_color=county_colors, fill_alpha=0.7,
        line_color="white", line_width=0.5, title="Texas Unemployment 2009")

show()
```

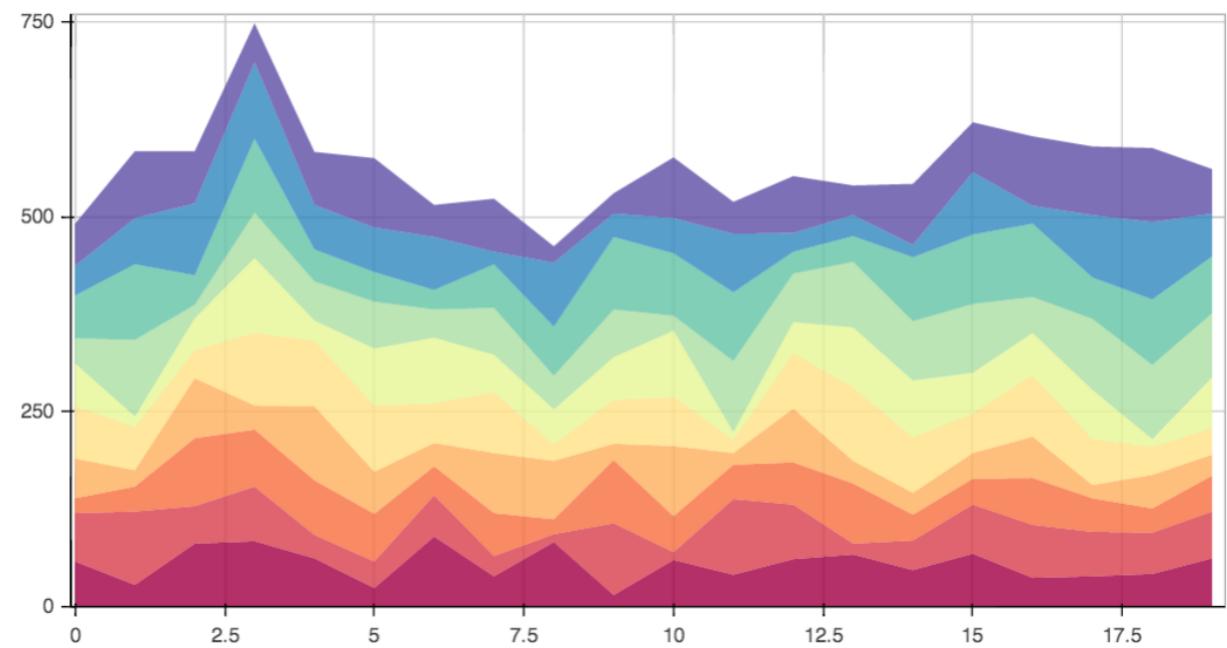

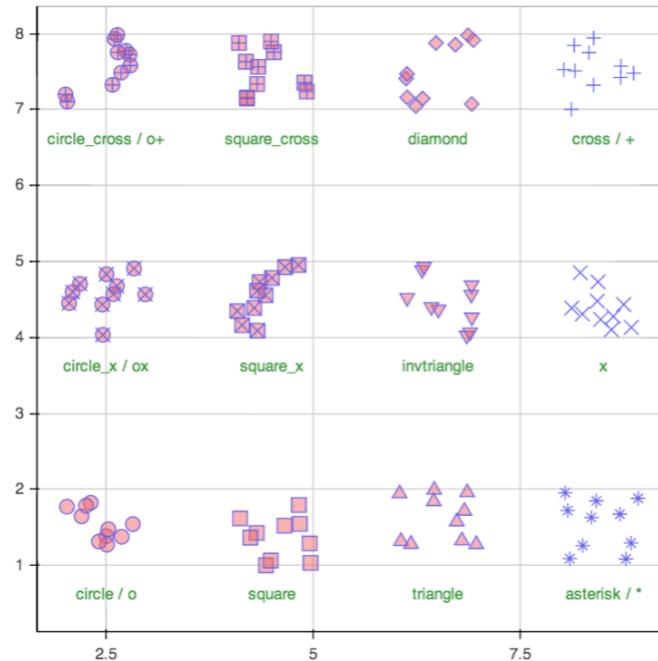

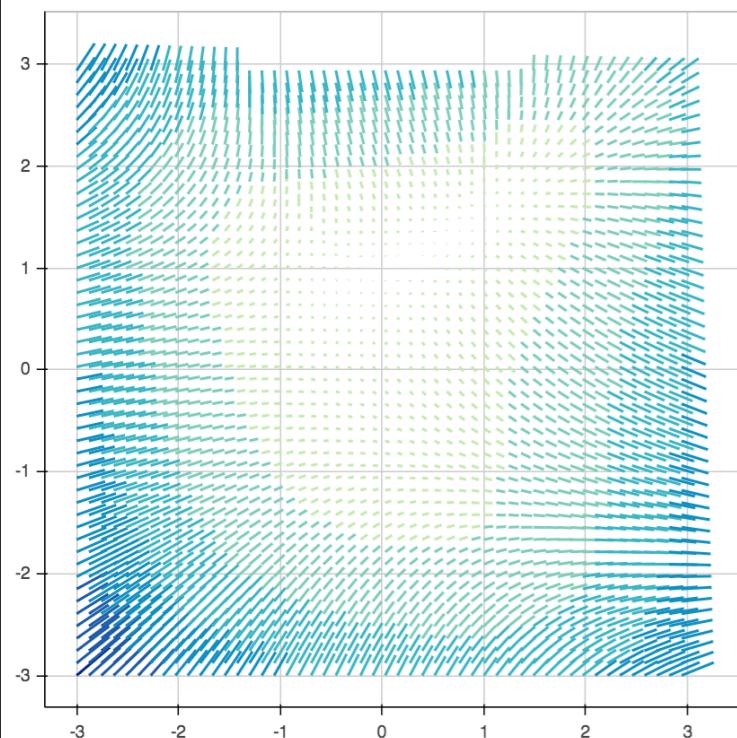

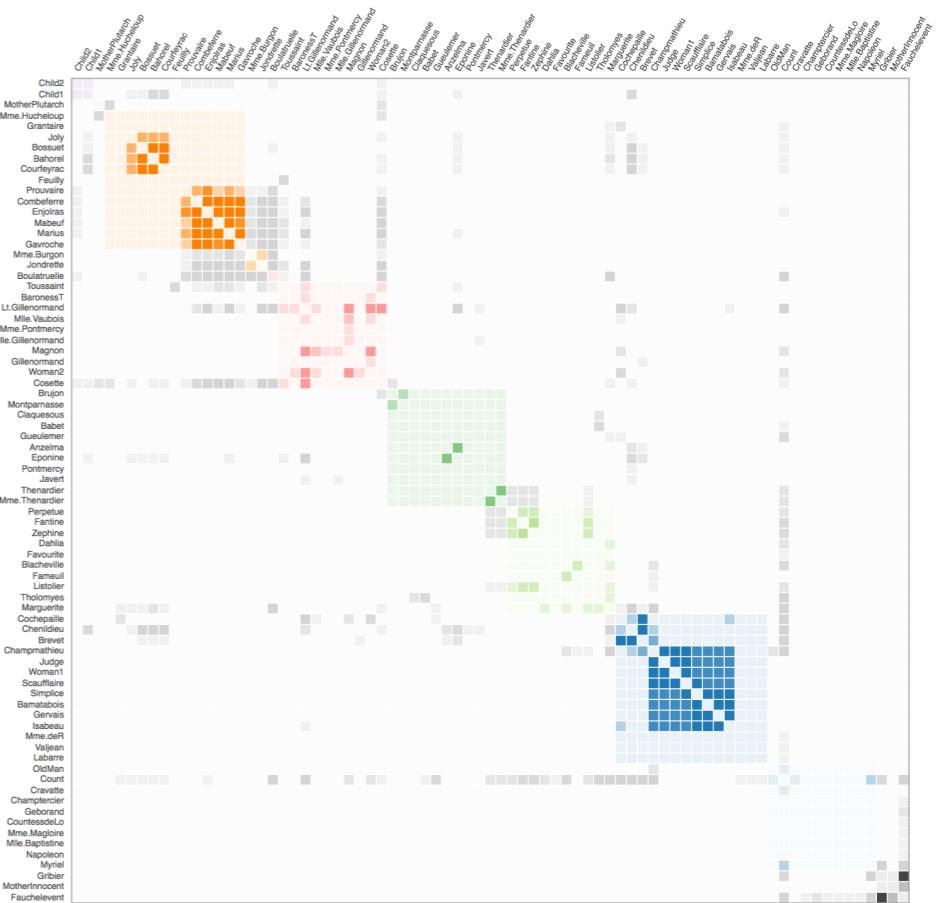

Log Normal Distribution ($\mu=0$, $\sigma=0.5$)

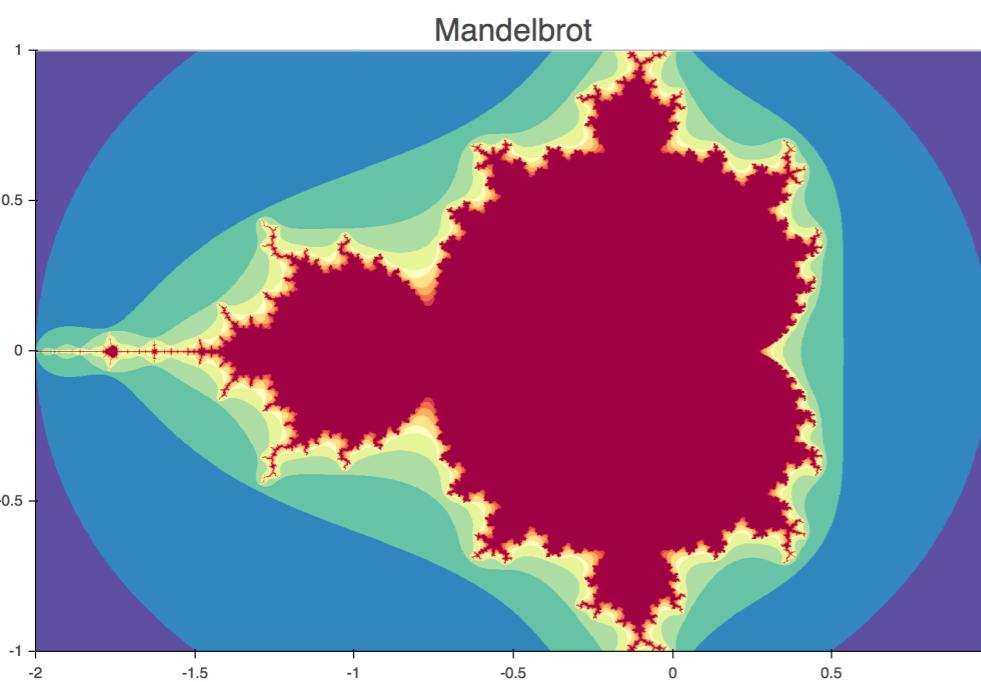

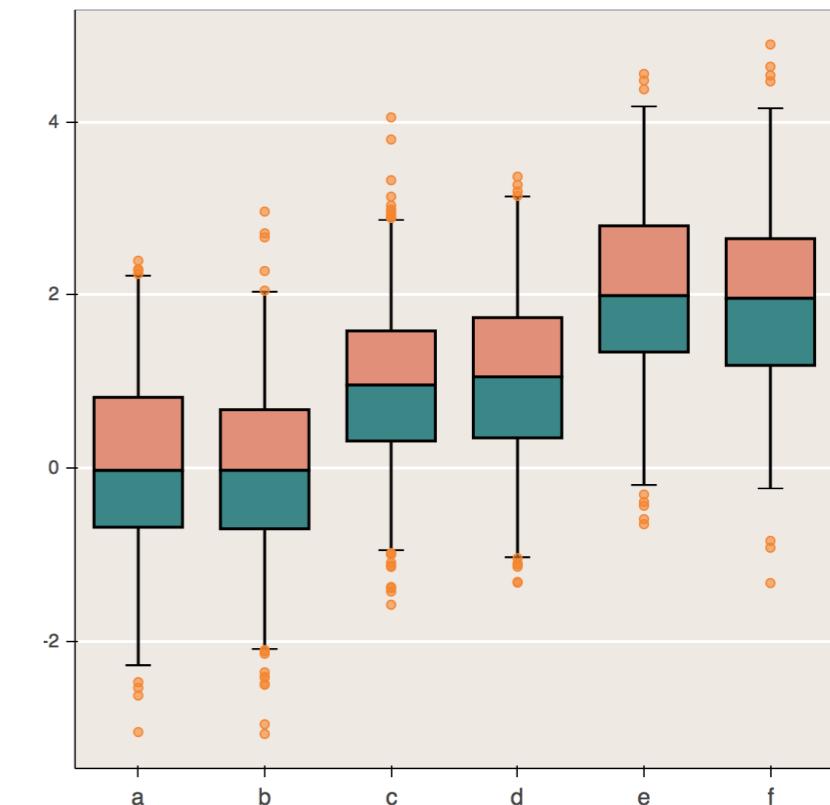

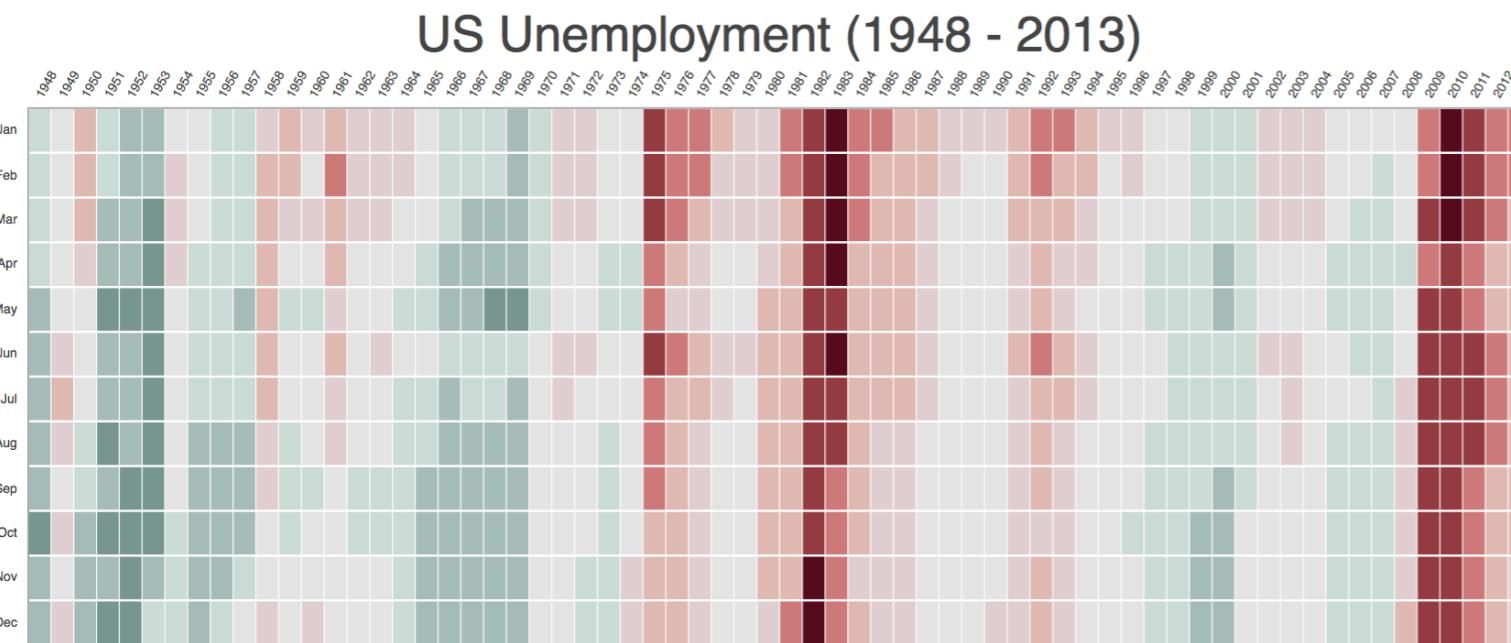

```
quad(top=hist, bottom=np.zeros(len(hist)), left=edges[:-1], right=edges[1:],  
      fill_color="#036564", line_color="#033649", background_fill="#E8DDCB",  
      title="Log Normal Distribution ( $\mu=0$ ,  $\sigma=0.5$ )", tools="")  
line(x, pdf, line_color="#D95B43", line_width=8, alpha=0.7, legend="PDF")  
line(x, cdf, line_color="white", line_width=2, alpha=0.7, legend="CDF")  
legend().orientation = "bottom_right"
```

Les Mis Occurrences (one at a time)

Periodic Table

1 H Hydrogen 1.00794(4)	2 He Helium 4.002602(2)
3 Li Lithium 6.941(2)	4 Be Beryllium 9.012182(3)
11 Na Sodium 22.98976928(2)	12 Mg Magnesium 24.3050(6)
19 K Potassium 39.0983(1)	20 Ca Calcium 40.078(4)
37 Rb Rubidium 85.4678(3)	38 Sr Strontium 87.62(1)
55 Cs Cesium 132.9054519(2)	56 Ba Barium 137.327(7)
87 Fr Francium [223]	88 Ra Radium [226]
103 Lr Lawrencium [262]	104 Rf Rutherfordium [267]
105 Db Dubnium [268]	106 Sg Seaborgium [271]
107 Bh Bohrium [272]	108 Hs Hassium [270]
109 Mt Meitnerium [276]	110 Ds Darmstadtium [281]
111 Rg Roentgenium [280]	112 Cn Copernicium [285]
113 Uut Ununtrium [284]	114 Uuo Ununoctium [289]
115 Uup Ununpentium [293]	116 Uuh Ununhexium [293]
117 Uus Ununseptium [293]	18 Rn Radon [222]

Coming soon

- Abstract Rendering — dynamic downsampling and data shading for millions of points
- Constraints based layout system
- Interactive tool improvements and additional tools
- Matplotlib compatibility — use Bokeh from pandas, ggplot.py, Seaborn
- Language bindings — Scala underway, more later
- Widget interactors and plugins

But don't forget

- Usability improvements
 - Discoverable parameters
 - Informative error messaging
 - Expanded live gallery
 - “Do the right thing” when it is possible
 - expose capability when it’s not

Need feedback from users (you!)
